

# Flask Deployment

Name: Flask Deployment for Model Based on Hotel Data

Submission Date: 7/28/2022

Internship Batch: LISUM11

Version: 1.0

Deployment by: Siddarth Vinnakota

## Step 1: Data Procurement and Cleaning

| Price in Millions | Profit | Square Meter | City    |
|-------------------|--------|--------------|---------|
| 21.88             | 119000 | 3938         | Berlin  |
| 27.95             | 250000 | 3986         | Munich  |
| 16.09             | 250000 | 2574         | Cologne |
| 27.58             | 145000 | 4155         | Munich  |
| 23.76             | 110000 | 3795         | Berlin  |
| 22.88             | 246000 | 2773         | Munich  |
| 13.25             | 54000  | 634          | Munich  |
| 8.94              | 2000   | 82           | Munich  |
| 24.87             | 114000 | 3706         | Munich  |
| 14.11             | 47000  | 1692         | Berlin  |
| 11.65             | 54000  | 1989         | Cologne |
| 17.26             | 124000 | 2616         | Berlin  |
| 18.45             | 125000 | 3358         | Cologne |
| 17.08             | 62000  | 1941         | Munich  |
| 19.32             | 250000 | 1831         | Munich  |
| 8.48              | 24000  | 800          | Berlin  |
| 14.16             | 102000 | 2700         | Cologne |
| 13.84             | 26000  | 1257         | Munich  |

...

## Step 2: Creation of a Regression Model

```
model.py
1  import numpy as np
2  import pandas as pd
3  import pickle
4  from sklearn.linear_model import LinearRegression
5
6  dataset = pd.read_csv('hotels.csv')
7
8  X = dataset.iloc[:, 1:3]
9
10 y = dataset.iloc[:,0]
11
12 regressor = LinearRegression()
13
14 regressor.fit(X,y)
15
16 pickle.dump(regressor, open('model.pkl','wb'))
17
18 #model = pickle.load(open('model.pkl','rb'))
19
20
```

### Step 3: App Creation

```
app.py
9  def home():
10     return render_template('index.html')
11
12  @app.route('/predict',methods=['POST'])
13  def predict():
14      '''
15      For rendering results on HTML GUI
16      '''
17      int_features = [int(x) for x in request.form.values()]
18      final_features = [np.array(int_features)]
19      prediction = model.predict(final_features)
20
21      output = round(prediction[0], 2)
22
23      return render_template('index.html', prediction_text='Hotel price (in Millions)')
24
25  if __name__ == "__main__":
26      app.run(port=5000)
27
```

### Step 4: HTML Deployment

## Predict Hotel Price for Purchase

Hotel price (in Millions) should be \$ 15.4
